

Activity

Software

With over 30 years of experience in accounting software development, Activity is the most robust and stable accounting solution in the marketplace today.

Data in High Definition

Activity's ability to visualize data instead of hiding it behind forms makes the data much more available. You can easily spot errors and inconsistencies. We call the Activity software "Accounting in HD".

Framework

Your business is not like any other business. Activity is designed as a framework so that you can adapt and easily customize the software for your specific applications. You can also customize and modify any report design.

Scalable

Activity was designed to grow with your company's needs. Charts of Account can be changed and enlarged, customers/vendors/employees can be combined, and entities can be obsoleted without losing historical records.

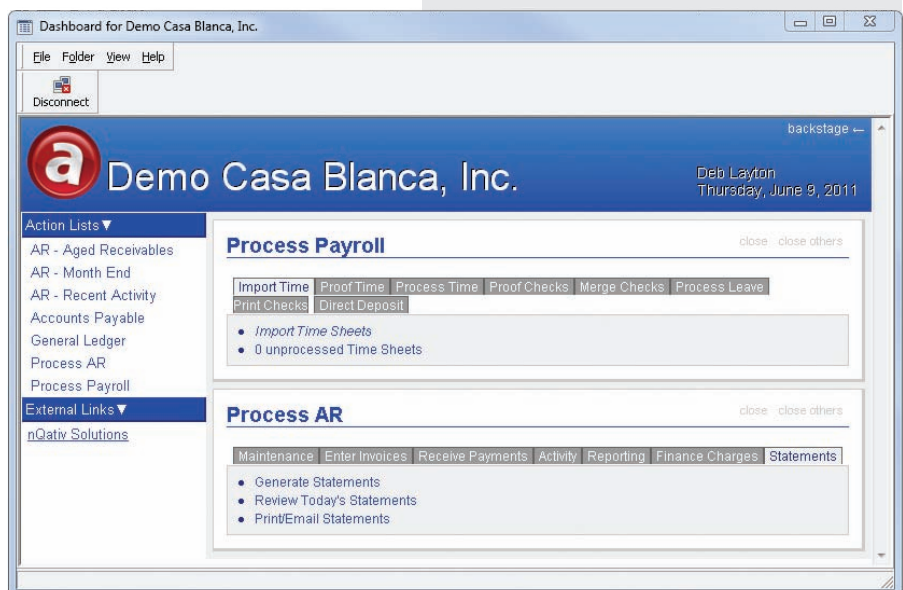

Usability

With features like "Mass Change", "Data Links", no required Closing Procedures, attachments, data imports, and "Dashboard", Activity will make your accounting staff fast and efficient.

Activity will streamline your accounting department and provide you timely data to make important business decisions.

Modules

- ActivGL-General Ledger
- ActivAP-Accounts Payable
- ActivAR-Accounts Receivable
- ActivPR-Payroll
- ActivHR-Human Resources
- ActivPO-Purchasing
- ActivBR-Bank Reconciliation
- ActivCRM-Customer Relations Management
- ActivFA-Fixed Assets (2011)
- ActivCP-Contracts Processing (2011)

Active Server Technology

Data is updated in real time so that any change made by any user automatically updates everyone's view of the data as soon as it is changed. This provides a consistent view of the data without the hassle of refreshing the screen to see the current state of the database.

Data Centric

Activity is a system where you "see the data". We refer to this as a "data centric" model. Traditional software is "process centric". Data centricity is similar to a spreadsheet in that your view of the accounting system is a tabular list showing the data from the database. You will not have to rely on codes to look up information about a particular vendor, customer, invoice or account.

Dashboard

Management can view summary information directly on the dashboard. If further detail is required, the manager only clicks on the summary information and the detail is shown. For example, if a manager is looking at past due customers, the detail of each customer and the related invoices is just a click away.

Change Log

All accounting systems audit dollars. However, Activity also allows you to audit changes to critical data such as employee data and vendor data. Change logs tell administrators who changed the data and when.

Security

Administrators define security views for all users. This allows the separation of duties within your company.

Import and Export

Import information from external systems, or data in other companies within Activity, through the Activity OAS. Payroll setup information, budgets, vendor records, invoices, payroll time sheets, and general ledger postings are all importable. Data can also be exported to almost any format including XML, HTTP, Excel, database, etc.

Custom Fields

You can easily add personalized or more specific information to virtually any entity. There are many different data types for custom fields such as an Exchange folder (email reference), internet address (websites), network folder, file, string, or reference. You can also add validation tables for the reference data type. Custom field data is functional for selecting, filtering, sorting, and mass change.

Drill Back/Drill Forward

Activity has the ability to drill into the detail from summary. If you look at a summarized payment posting in the General Ledger, you can drill back to the original voucher and even to a scanned image of the original vendor invoice.

Activity also does "drill forward". If you look at an original invoice in the accounts receivable system, you can drill forward and look at the summary posting in the general ledger where it is accumulated with many other invoices.

Mass Change

Massive data changes to the database are fast and easy with the mass change capability. You no longer have to "visit" each record with the GUI form to change data.

Paperless Document Management

Management can view summary information directly on the dashboard. If further detail is required, the manager only clicks on the summary information and the detail is shown. For example, if a manager is looking at past due customers, the detail of each customer and the related invoices is just a click away.

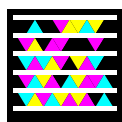

Data Links

Data maintenance and consistency is greatly enhanced with the data link capability which allows you to associate like data in different tables. For example an employee's address can be linked to an AP vendor. When the address is changed in one table (AP), the data link will automatically change the related data in the other table (PR).

Reports

View, print, export, or design essential reports using Crystal Reports™. Multiple named report designs are available for each report and are selectable at run time.
